

DL QUALITY
DL Technical Solution – DL Kit

DL Quality: 01

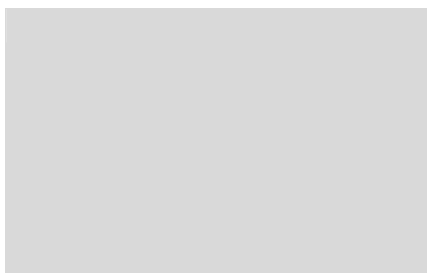

Test report 02

The DL KITS are preconfigured solutions as regards their hardware and software definitions, designed to meet specific needs within the production process and to allow a gradual, user-friendly introduction of the integrated IT production system. They are available in different versions involving the use of the Totem and one called Desktop. The Totem version allows placing the KIT on the shop floor without the aid of special fixtures or supports while the Desktop version, designed for greater flexibility, allows the KITS to be used on work stations where the Totem is not considered necessary. The type of network to be used (whether wireless or wired) will be defined according to the type of PC chosen by the customer. DL QUALITY is a CE marking kit. It is used to identify the operator using the iButton or password and to select the door/window by reading the bar code of any of its constituent parts. DL QUALITY tells the operator what tests are to be carried out, records them immediately afterwards, reports any non-conformities and any solutions adopted.

DL QUALITY

DL Technical Solutions – DL Kit

01

DL Quality

DL Quality, CE marking software, enables the operator to view and fill in the plan of tests to be carried out on the style or job order and to keep a record of the tests carried out together with the results obtained, including any non-conformities and solutions adopted. The test plan to be executed is prepared in the office using the FP Quality software (not included in the KIT) and sent to the Filo PC along a network connection.

02

Test Report

All tests indicated by the operator are saved automatically on the server or PC in the office on which the FP Quality software is installed. In this way, the system regularly files all the test plans of the job orders executed in the workshop, thus relieving the customer of the tedious task of distributing, collecting and filing these documents himself.

03

Industrial Tablet PC FILO 10" or FILO 15"

Filo is an industrial tablet PC coming in two versions: portable (Filo 10") or desktop (Filo 15"). It is provided with a touch-screen interface that allows the operator to use the software without the aid of a mouse or keyboard. It has been designed especially for the shop floor, hence it is dust- and spray proof etc. For Filo 10" there is provision for connection with WIFI network while for Filo 15" it is possible to choose between WIFI or wired network.

04

Bar code reader

The bar code reader enables the system to automatically identify the style and consequently the job order of which the workpiece in question forms a part.

Models	DL QUALITY
